

Yuzone Rebirth - Product Blueprint

1. Origin Story

The project started because existing music platforms created a fragmented experience:

- Spotify mods worked on desktop but mobile was inconsistent.
- The goal became creating a music platform with freedom, sync, and ownership.

The original Yuzone solved:

- Accounts
- Playlists
- Likes
- History
- Playback state
- Sharing
- Recommendations

The biggest problem was playback infrastructure.

2. Architecture Journey

Version 1:

Frontend

- > Backend
- > yt-dlp
- > FFmpeg
- > MP3 streaming
- > Laptop + Cloudflare tunnel

Problems:

- Laptop overheating
- Not scalable
- Hosting problems

Version 2:

Frontend

- > Resolver API
- > yt-dlp extract_info()
- > Direct stream URL

Improvements:

- No audio processing
- No downloads
- No FFmpeg

Problem:
Cloud servers triggered YouTube bot detection.

Final Architecture:

Frontend
-> YouTube iframe/player API

Backend:
- Users
- Metadata
- Playlists
- History
- Recommendations
- Sync

Advantages:
- No cookies
- No yt-dlp
- No server streaming
- Free hosting compatible
- Scalable

3. New Platform Philosophy

Do not rebuild a Spotify clone.

Build:
"A personal music universe"

The app is not just a player.
It is a layer for:

- Taste
- Memories
- Discovery
- Identity
- Social listening

4. Possible Brand Names

Top candidates:

Resona
Meaning: resonance
Premium, emotional, startup style.

Vynl
Modern identity based around music culture.

Auralis
Premium futuristic audio feel.

Muse / MuseOS
Music operating system concept.

Sonar
Finding your frequency.

5. Database Migration Plan

Old Yuzone MongoDB exported:

Collections:

- users
- playlists
- likedsongs
- playbackhistories
- playerstates
- recentlyplayed
- shares
- podcastshows
- podcastepisodes
- seasons
- futuresuggestions

Migration strategy:

Create new Atlas DB.
Import JSON exports.
Update backend environment.

Fresh identity.
Old intelligence.

6. New Frontend Roadmap

Recommended stack:

Next.js
React
Tailwind CSS
shadcn/ui

Framer Motion
Zustand
TanStack Query

Core structure:

Home
Search
Library
Playlist pages
Profile
Player system

Build order:

1. Authentication
2. Search
3. YouTube player engine
4. Playlists
5. Likes
6. History
7. Polish

Do not start with landing pages.

7. Player Architecture

Use a global Music Provider.

State:

- current song
- queue
- playing status
- volume
- progress

Controls:

play()
pause()
seek()
next()
previous()

Internally powered by YouTube iframe API.

User only sees custom UI.

8. Differentiating Features

AI DJ:

Example:

"Play something for late night coding"

Dynamic mood transitions.

Taste Profile:

Energy score
Mood analysis
Era preference
Language mix

Music Passport:

Public music identity:

- top artists
- listening personality
- stats

Listening Rooms:

Friends share:

- queue
- timestamp
- playback session

Memory Library:

Not just playlists.

Examples:

- songs from summer
- late night repeats
- forgotten favorites

9. Monetization Philosophy

Never lock the reason the app exists.

Keep free:

- Listening
- Search
- Playlists
- Likes
- History
- Sync

Premium should enhance.

Possible Plus plan:

AI DJ
AI playlist generation
Advanced stats
Taste analysis
Profile customization
Themes

Possible pricing:

Affordable student-friendly model.

Idea:
Free is amazing.
Paid feels magical.

10. Final Vision

Not:

"Another Spotify clone"

Instead:

A music identity platform.

Core idea:

Your music.
Your memories.
Your universe.

The old project provided the lessons.
The new platform builds from those lessons with a stronger foundation.
